# Structured documents and (X)HTML

Week 3 LBSC 690

#### Web Standards

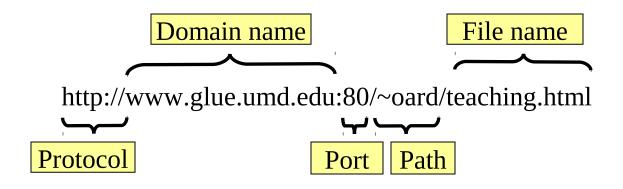

- URL
  - Where to find the information

- HTTP
  - How to get the information

- HTML
  - How to write and interpret the information

#### Uniform Resource Locator (URL)

Uniquely identify Web pages

Request for directory retrieves "index.html"

### HyperText Transfer Protocol (HTTP)

#### Send request

GET /path/file.html HTTP/1.0

From: someuser@jmarshall.com

User-Agent: HTTPTool/1.0

#### Server response

HTTP/1.0 200 OK

Date: Fri, 31 Dec 2011 23:59:59 GMT

Content-Type: text/html

Content-Length: 1354

</html>

# HyperText Markup Language (HTML)

Simple document structure language for Web

- Advantages
  - Adapts easily to different display capabilities
  - Widely available display software (browsers)
- Disadvantages
  - Does not directly control layout

#### Rendering

- Different devices have different capabilities
  - Desktop
  - -PDA
- Rendering maps logical tags to physical layout
  - Controls line wrap, size, font...
    - Place the title in the page border
    - Render <h1> as 24pt Times
    - Render <strong> as bold
- Somewhat browser-dependent
  - Slight differences in Internet Explorer, Firefox, Safari

#### HTML Document Structure

- "Tags" mark structure
  - <html>a document</html>
  - an ordered list
  - <i>something in italics</i></i>
- Tag name in angle brackets <>
  - Not case sensitive
- Open/Close pairs
  - Close tag is sometimes optional (if unambiguous)
- Element is tag and contents

#### "Hello World" $HTML_{\mbox{\scriptsize This}}$ is the header

```
<html>
<head>
<title>Hello World!</title>
</head>
<body>
Hello world! This is my first webpage!
</body>
</html>
```

This is the actual content of the HTML document

# Hands On: Graphical Secure FTP

- Connect to "terpconnect.umd.edu"
  - If connecting for the first time, it asks about certificate, accept
- Change directory to "/pub/USERID"
- Upload or download files
- You can see these files at: http://terpconnect.umd.edu/~USERID/

### HTML Page Editing Tips

- Edit files on your own machine
  - Upload when you're happy
- Save early, save often, just save!
- Reload browser to see changes
- File naming
  - Don't use spaces
  - Punctuation matters

# Hands On: Learning HTML From Examples

- Use browser to find a page you like
- On the "View" menu select "Source" (in IE9)
  - Opens a window with the source
- Compare HTML source with the Web page
  - Observe how each effect is achieved

## Logical Structure Tags

- Head
  - Title
- Body
  - Headers: <h1> <h2> <h3> <h4> <h5>
  - Lists: , (can be nested)
  - Paragraphs:
  - Tables:

#### Physical Structure Tags

- Appearance
  - − Bold: <b></b>
  - − Italics: <i></i></i>
- Font tag
  - Typeface: <font face="Arial"></font>
  - Size: <font size="+1"></font>
  - Color: <font color="#aabbcc"></font>

## (Hyper)Links

#### Source Document: index.html

```
<html>
<head>
<title>Hello World!</title>
</head>
<body>
Hello world! This is my first webpage!
Click <a href="test.html">here</a> for another page.
</body>
</html>
```

#### **Target Document: test.html**

```
<html>
<head>
<title>Another page</title>
</head>
<body>
This is another page.
</body>
</html>
```

#### Hypertext "Anchors"

- **Internal anchors**: somewhere on the same page
  - <a href="#students"> Students</a>
    - Links to: <a name="students">Student Information</a>

- External anchors: to another page
  - <a href="http://www.ischool.umd.edu">iSchool</a>
  - <a href="http://www.ischool.umd.edu/faculty/#node-531"> Douglas W. Oard</a>

#### Paths in Anchors

- URL may be complete or relative to current page
- In: ischool.umd.edu/content/prospective-students
  - url: href="http://ischool.umd.edu/content/research"
  - equivalent to relative path: href="/content/research"
  - and even this: href="research"

- File name part of URL is case sensitive (on Unix servers)
  - Protocol and domain name are not case sensitive

#### **Images**

- <img src="URL"> or <img src="path/file">
  - <img
    src="http://www.ischool.umd.edu/sites/all/themes/ischoo
    l/images/ischool\_logo\_home.gif">
  - At http://www.ischool.umd.edu, equivalent to:
  - <img
    src="/sites/all/themes/ischool/images/ischool\_logo\_home
    .gif">
  - SRC: can be url or path/file
  - ALT: a text string if not showing image

#### Image Hyperlinks

Can use image within anchor to link:

```
<a href=LINKURL><img src=IMAGEURL></a>
```

```
Example:
<a href="http://www.umd.edu/">
<img
    src="/sites/all/themes/ischool/images/um_logo.jpg"
    alt="University of Maryland" /></a>
```

#### **Tables**

eenie meenie miney mo catch a tiger <tr>>tr>>td>>td>>td>

#### Table Example

```
<caption align="right">The caption</caption>
  Header1 
    Header2
 first row, first item 
   first row, second item
 second row, first item
   second row, second item
```

# Common HTML Pattern: Grid Layouts

Navigation Bar

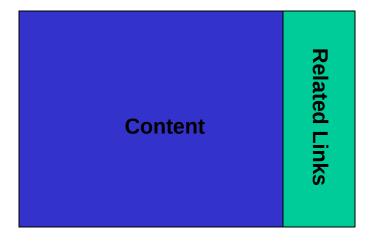

Navigation Bar

Content

Navigation Bar

Navigation Bar

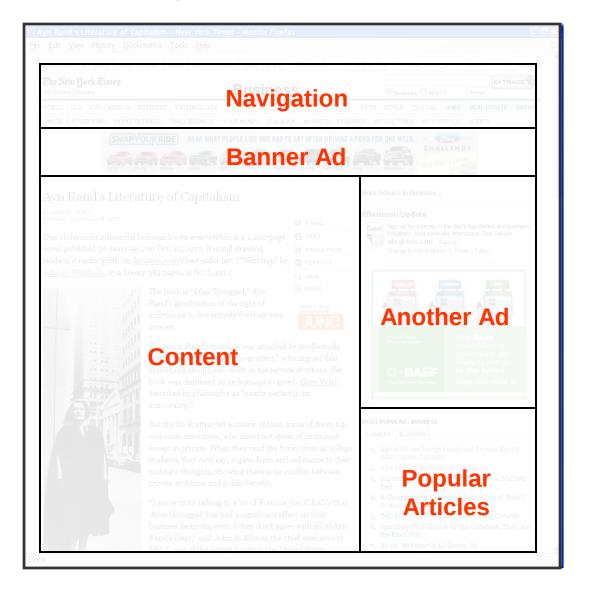

Content

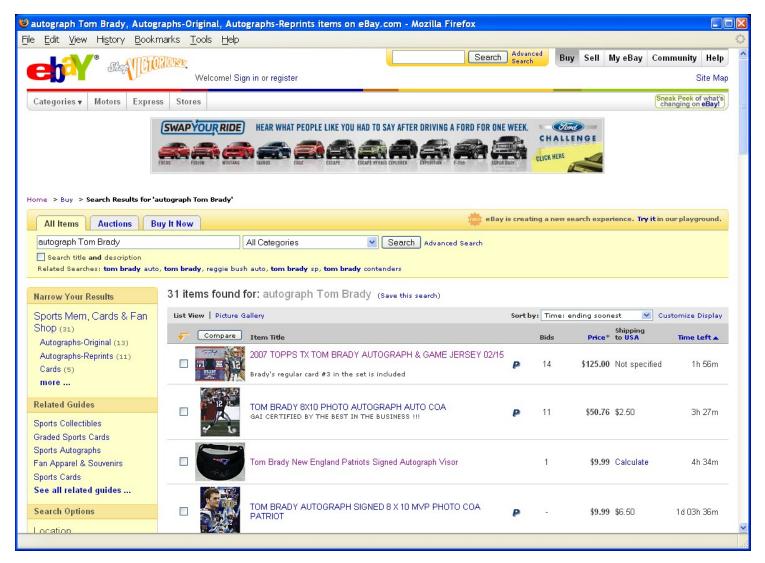

# Grid Layout: NY Times

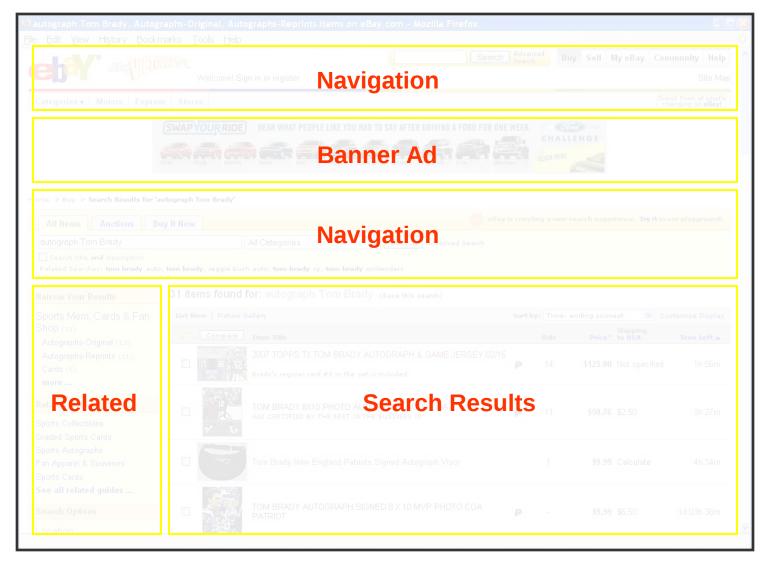

## Grid Layout: NY Times

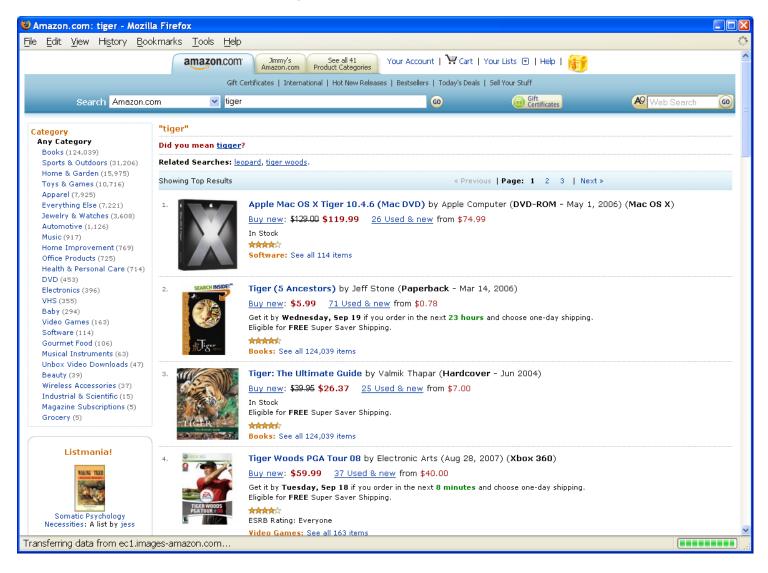

# Grid Layout: ebay

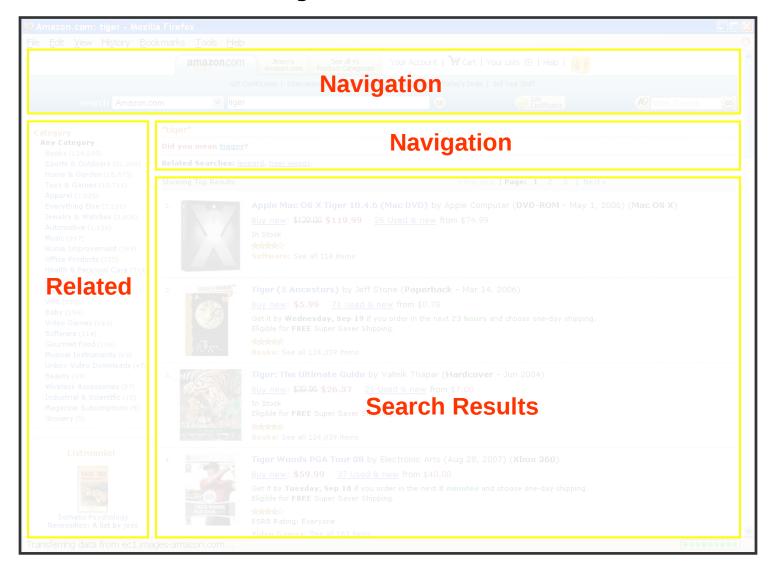

# Grid Layout: ebay

## Grid Layout: Amazon

### Grid Layout: Amazon

# Markup Languages: Writing Wikipedia Pages

Wikipedia uses MediaWiki software

- MediaWiki has its own markup language
  - http://en.wikipedia.org/wiki/MediaWiki
  - MediaWiki syntax vs. Equivalent HTML and Rendered output

#### Wikipedia Infobox

- Infoboxes summarize important points
  - Types for business, biological taxonomy, video game characters, etc.

Simple markup language

Expanded to generate table for infobox

# Structured Documents: Wikipedia Page Organization

- Table of Contents
  - We just enter the section titles
  - MediaWiki creates TOC box with internal links

- References
  - We just put citations within text
  - MediaWiki numbers them and creates a section

#### **WYSIWYG**

- Anything you can do you can see
  - Everything you can do you can see

MediaWiki markup helpful for pages

Need HTML for e.g. representing forms

#### HTML Editors

- Several are available
  - Adobe Dreamweaver available commercially
  - Microsoft Word
- Tend to use physical layout tags extensively
  - Detailed control can make hand-editing difficult
- You may still need to edit the HTML file
  - Some editors use browser-specific features
  - Some HTML features may be unavailable
  - File names may be butchered when you upload

#### HTML Validators

- Syntax checking: cross-browser compatibility
  - http://validator.w3.org
  - Try it on http://www.umd.edu ☺

- Style checking: Section 508 compliance
  - http://www.cynthiasays.com/
  - Try it on http://www.umd.edu ☺

#### What's Wrong with the Web?

- HTML
  - Confounds structure and appearance (XML)
- HTTP
  - Can't recognize related transactions (Cookies)
- URL
  - Links breaks when you move a file (PURL)

#### What's a Document?

Content

Structure

Appearance

Behavior

#### History of Structured Documents

- Early standards were "typesetting languages"
  - NROFF, TeX, LaTeX, SGML
- HTML was developed for the Web
  - Too specialized for other uses
- Specialized standards met other needs
  - Change tracking in Word, annotating manuscripts, ...
- XML seeks to unify these threads
  - One standard format for printing, viewing, processing

#### eXtensible Markup Language (XML)

- SGML was too complex
- HTML was too simple
- Goals for XML
  - Easily adapted to specific tasks
    - Rendering Web pages
    - Encoding metadata
    - "Semantic Web"
  - Easily created
  - Easily processed
  - Easily read
  - Concise

#### Some Basic Rules for XML

- XML is case sensitive
- XML declaration is the first statement
  - <?xml version="1.0"?>
- An XML document is a "tree"
  - Must contain one root element
  - Other elements must be properly nested
- All start tags must have end tags ok if same
- Attribute values must have quotation marks
  - <item id="33905">
- Certain characters are "reserved"
  - For example: <u>&lt</u>; is used to represent <</p>

# Really Simple Syndication (RSS)

```
<?xml version="1.0"?>
<rss version="2.0">
<channel>
  <title>Lift Off News</title>
  k>http://liftoff.msfc.nasa.gov/</link>
  <description>Liftoff to Space Exploration.</description>
  <language>en-us</language>
  <pubDate>Tue, 10 Jun 2003 04:00:00 GMT</pubDate>
  <lastBuildDate>Tue, 10 Jun 2003 09:41:01 GMT</lastBuildDate>
  <docs>http://blogs.law.harvard.edu/tech/rss</docs>
  <generator>Weblog Editor 2.0</generator>
  <managingEditor>editor@example.com</managingEditor>
  <webMaster>webmaster@example.com</webMaster>
  <ttl>5</ttl>
  <item>
    <title>Star City</title>
    http://liftoff.msfc.nasa.gov/news/2003/news-starcity.asp</link>
    description>How do Americans get ready to work with Russians aboard the International Space Station? They take
                 a crash course in culture, language and protocol at Russia's Star City.</description>
    <pubDate>Tue, 03 Jun 2003 09:39:21 GMT</pubDate>
    <guid>http://liftoff.msfc.nasa.gov/2003/06/03.html#item573/guid>
  </item>
</channel>
```

See example at http://www.nytimes.com/services/xml/rss/

</rss>

# XML: A Family of Standards

- Definition: DTD
  - Known types of entities with "labels"
  - Defines part-whole and is-a relationships

- Markup: XML
  - "Tags" regions of text with labels

## Document Type Definition (DTD)

```
<!ELEMENT poem ( (title, author, stanza)* )
<!ELEMENT title (#PCDATA) >
<!ELEMENT author (firstname, lastname) >
<!ELEMENT firstname (#PCDATA) >
<!ELEMENT lastname (#PCDATA) >
<!ELEMENT stanza (line+ | linein+) >
<!ELEMENT line (#PCDATA) >
<!ELEMENT linein (#PCDATA) >
```

```
ярста span of text

a,b a followed by b

a|b either a or b

a* 0 or more a's

a+ 1 or more a's
```

## XHTML Example

- View "The Song of the Wandering Aengus"
  - http://www.umiacs.umd.edu/~oard/teaching/690/spring08/notes/3/xml.htm
- Built from three files
  - yeats01.xml
  - poem01.dtd
  - poem01.xsl

#### XML Example

```
<?xml version="1.0"?>
<!DOCTYPE POEM SYSTEM "poem01.dtd">
<?xml-stylesheet type="text/xsl" href="poem01.xsl"?>
<POEM>
       <TITLE>The Song of Wandering Aengus</TITLE>
       <AUTHOR> <FIRSTNAME>W.B.</FIRSTNAME>
                  <LASTNAME>Yeats</LASTNAME>
       </AUTHOR>
<STANZA>
       <LINE>I went on to the hazel wood,</LINE>
       <LINEIN>Because a fire was in my head,</LINEIN>
       <LINE>And cut and peeled a hazel wand,</LINE>
</STANZA>
</POFM>
```

## XHTML: Writing HTML as XML

```
<?xml version="1.0" encoding="iso-8859-1"?>
<html xmlns="http://www.w3.org/TR/xhtml1" >
<head>
 <title> Title of text XHTML Document </title>
</head>
<body>
<div class="myDiv">
  <h1> Heading of Page </h1>
   here is a paragraph of text. I will include inside this paragraph
       a bunch of wonky text so that it looks fancy. 
   Here is another paragraph with <em>inline emphasized</em>
      text, and <b> absolutely no</b> sense of humor. 
  And another paragraph, this one with an <img src="image.gif"</p>
      alt="waste of time" /> image, and a <br /> line break. 
</div>
</body></html>
```

#### Even More Uses of XML ...

- **CML** Chemical Markup Language
- **CellML** biological models
- BSML bioinformatic sequences
- **MAGE-ML** MicroArray Gene Expression
- **XSTAR** for archaeological research
- MARCXML MARC in XML
- AML astronomy markup language
- **SportsML** for sharing sports data

## Some Layout Guidelines

- Contrast: make different things different
  - to bring out dominant elements
  - to create dynamism
- Repetition: reuse design throughout the interface
  - to achieve consistency
- Alignment: visually connect elements
  - to create flow
- Proximity: make effective use of spacing
  - to group related and separate unrelated elements

#### Summary

- Learning to build simple Web pages is easy
  - Which is good news for the homework!
- Grid Layout facilitated by tables and CSS

- All documents are structured documents
  - But some expose the structure better than others
- XML is a flexible markup language
  - Complete separation of structure and appearance

#### Before You Go

On a sheet of paper, answer the following (ungraded) question (no names, please):

What was the muddiest point in today's class?
